CARMENES target characterisation
Mining public archives for high-
resolution spectra of M dwarfs with
exoplanets

Héctor Martínez
Universidad Complutense
de Madrid
Directores: D. Montes, J. A. Caballero

Introduction

- **CARMENES target characterisation: mining public archives for high-resolution spectra of M dwarfs with exoplanets**
- 2093 M dwarfs in CARMENCITA database (February 2014). Spectral types from M0 to M9
- 128 UVES spectra of 61 stars in the range 3250-10500 Å
- Aims: the spectral characterisation of the maximum possible number of stars will be essential for CARMENES to discover M dwarfs that are candidates to host exoplanets

Introduction: HARPS & UVES

- High-resolution spectrographs
- HARPS ($R = 115,000$): measurement of radial velocities. Long term radial velocity accuracy. Cassegrain focus of the 3.6 m telescope in La Silla
- UVES ($R = 40,000 - 110,000$): optical spectrograph. Two arms: UV to Blue, and Visual to Red. Nasmyth B focus of UT2 telescope in Cerro Paranal

Introduction: HARPS & UVES

Introduction: HARPS & UVES

Analysis

- We have correlated CARMENCITA database stars with HARPS and UVES catalogues. Classification based on priorities (Alpha, Beta, Gamma, Delta)

Analysis: UVES spectra

- 12 different channels. 128 spectra ($72+7+14+35$) of 61 stars ($32+4+11+4$). 37 spectra should be thrown away (low S/N ratio, cosmic rays, bad quality, primary companions)
- One-dimension spectra read thanks to IRAF
- We have measured pseudo-equivalent widths (*pEWs*) of lines in absorption and emission and rotational velocities thanks to these spectra

Analysis: UVES spectra BLU390

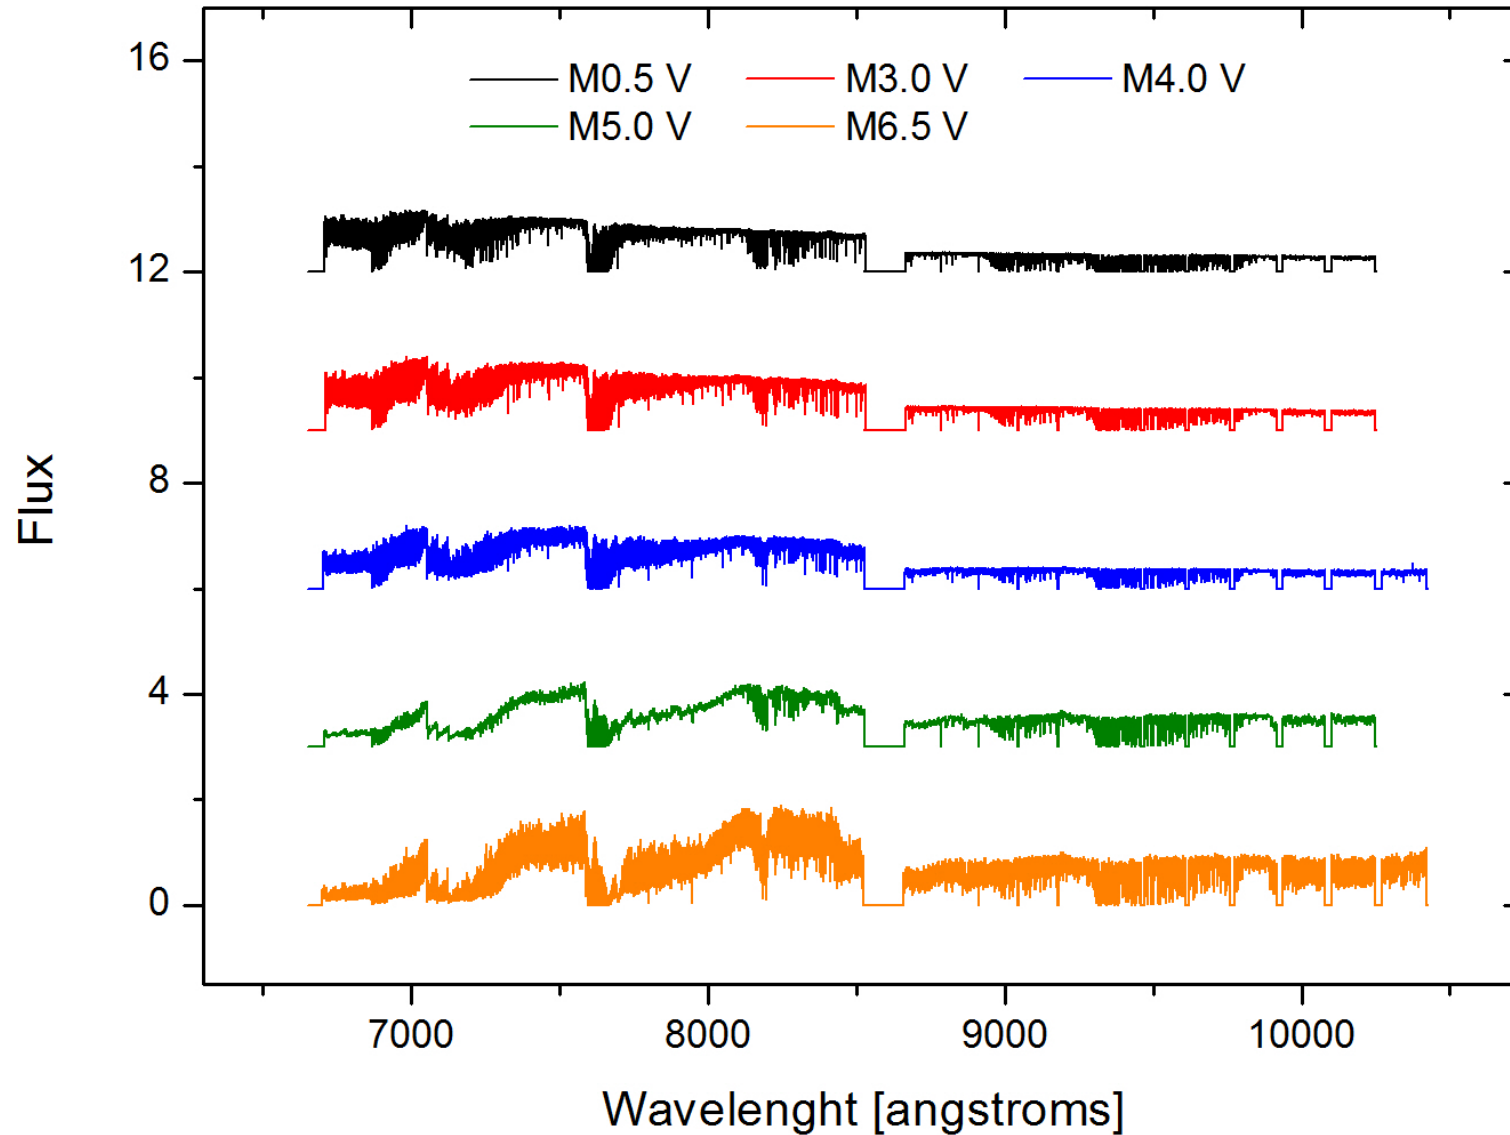

Analysis: UVES spectra BLU437

Analysis: UVES spectra RED580

Analysis: UVES spectra RED860

Analysis: *pEW*s

- Balmer series: $H\alpha$, $H\beta$, $H\gamma$, $H\delta$, $H\epsilon$, $H\zeta$, $H\eta$
- $\text{He I } D_3$, $\text{Na I } D_1 \& D_2$, Ca II H\&K lines
- Positive values for absorption lines and negative values for emission lines
- **splot** task, integration with **e** (small vertical movements along the lines centres)
- Final *pEW* values: arithmetic mean of three measurements and standard deviation as the statistical error

Analysis: *pEWs*

Analysis: H α line

- $pEW(H\alpha)$ values will help us to find both low- and high-activity stars
- 37 values for 35 stars
- 8 values already present in CARMENCITA (“old”)

Analysis: H α line

Analysis: H α line

Analysis: rotational velocities

- The rotation of an M dwarf is closely related to its chromospheric activity: the faster the star rotates, the more active it is
- Typically, M dwarfs rotational velocities are located in the range 2-30 km/s
- Cross-correlation profiles with IRAF (**fxcor**) to calculate $v \sin i$

Analysis: rotational velocities

NOAO/IRAF V2.14EXPORT alumnos@astrolab11.fis.ucm.es Wed 10:15:42 14-May
Object='J22532_rot30' Temp='J22532_rebin' npts=4096 aperture=1
Star = 'synthesis_G1-876' Template = 'G1-876'

Analysis: rotational velocities

Analysis: rotational velocities

- We need “template” stars with low rotation with which to compare the problem stars
- We have found low-rotation stars in our sample taking the ones with H α absorptions: 7 template stars
- Wavelength range: BLU437, RED564 and RED580 channels
- Spectra broadened using the program **starmod** to build calibration curves (FWHM vs $v \sin i$)

Analysis: rotational velocities

Results: pEW s vs $pEW(H\alpha)$

- Linear fits for all the pEW values
- The only fit that approaches to a straight line corresponds to H ζ line ($R^2 = 0.8741$)
- Pearson coefficients for He, Na and Ca fits are very low, although there exists a tendency
- In most of the cases there are few stars that get out of the linear fits (probably caused by flares)

Results: pEW s vs $pEW(H\alpha)$

Results: pEW s vs spectral types

- Low-activity stars are usually the early-type ones
- High-activity stars are usually the late-type ones
- Again, we have found some stars that probably present flares

Results: pEW s vs spectral types

Results: flares

- 8 stars that likely present flares
- Balmer decrement $pEW(H\alpha)/pEW(H\beta)$
- Relatively low in the case of flares

Results: flares

Results: values of $v \sin i$

- $v \sin i$ values for 24 stars. 17 stars have a registered value in CARMENCITA database
- Narrow profiles: for 8 stars, including our templates, we have obtained $v \sin i = 0^*$. Lower limit close to 2-3 km/s
- In general, our results differ very little from the ones of CARMENCITA. There is a remarkable discrepancy for one star (one of our templates)

Results: values of $v \sin i$

Results: values of $v \sin i$

Results: $pEW(H\alpha)$ vs $v \sin i$

Conclusions

- 128 UVES spectra for 61 stars
- $pEW(H\alpha)$ for 35 stars with 27 new values
- $v \sin i$ for 24 stars with 7 new values
- We have found both low- and high-activity stars. The first ones are interesting for CARMENES (radial velocity profiles)

Preparation of the **CARMENES** Input Catalogue

Mining public archives for stellar parameters and spectra of M dwarfs with master thesis students

D. Montes⁸, J. A. Caballero¹⁰, F. J. Alonso-Floriano⁸, M. Cortés-Contreras⁸, E. González-Álvarez⁸, D. Hidalgo⁸, G. Holgado⁸, H. Martínez-Rodríguez⁸, J. Sanz-Forcada¹⁰ and the CARMENES Consortium^{1,2,3,4,5,6,7,8,9,10,11} (<http://carmenes.caha.es/>)

We are compiling the most comprehensive database of M dwarfs ever built, CARMENCITA, the **CARMENES Cool dwarf Information and daTa Archive**, which will be the CARMENES 'input catalogue'. In addition to the science preparation with low- and high-resolution spectrographs and lucky imagers (see the other posters at Cool Stars 18), we compile a huge pile of public data on over 2100 M dwarfs, and analyze them, mostly using virtual-observatory tools. Here we describe four specific actions carried out by *master students*. They mine public archives for additional high-resolution spectroscopy (UVES, FEROS and HARPS), multi-band photometry (*FUV-NUV-u-B-g-V-r-R-i-J-H-Ks-W1-W2-W3-W4*), X-ray data (*ROSAT*, *XMM-Newton* and *Chandra*), and periods, rotational velocities and H α pseudo-equivalent widths. As described, there are many interdependences between all these data.

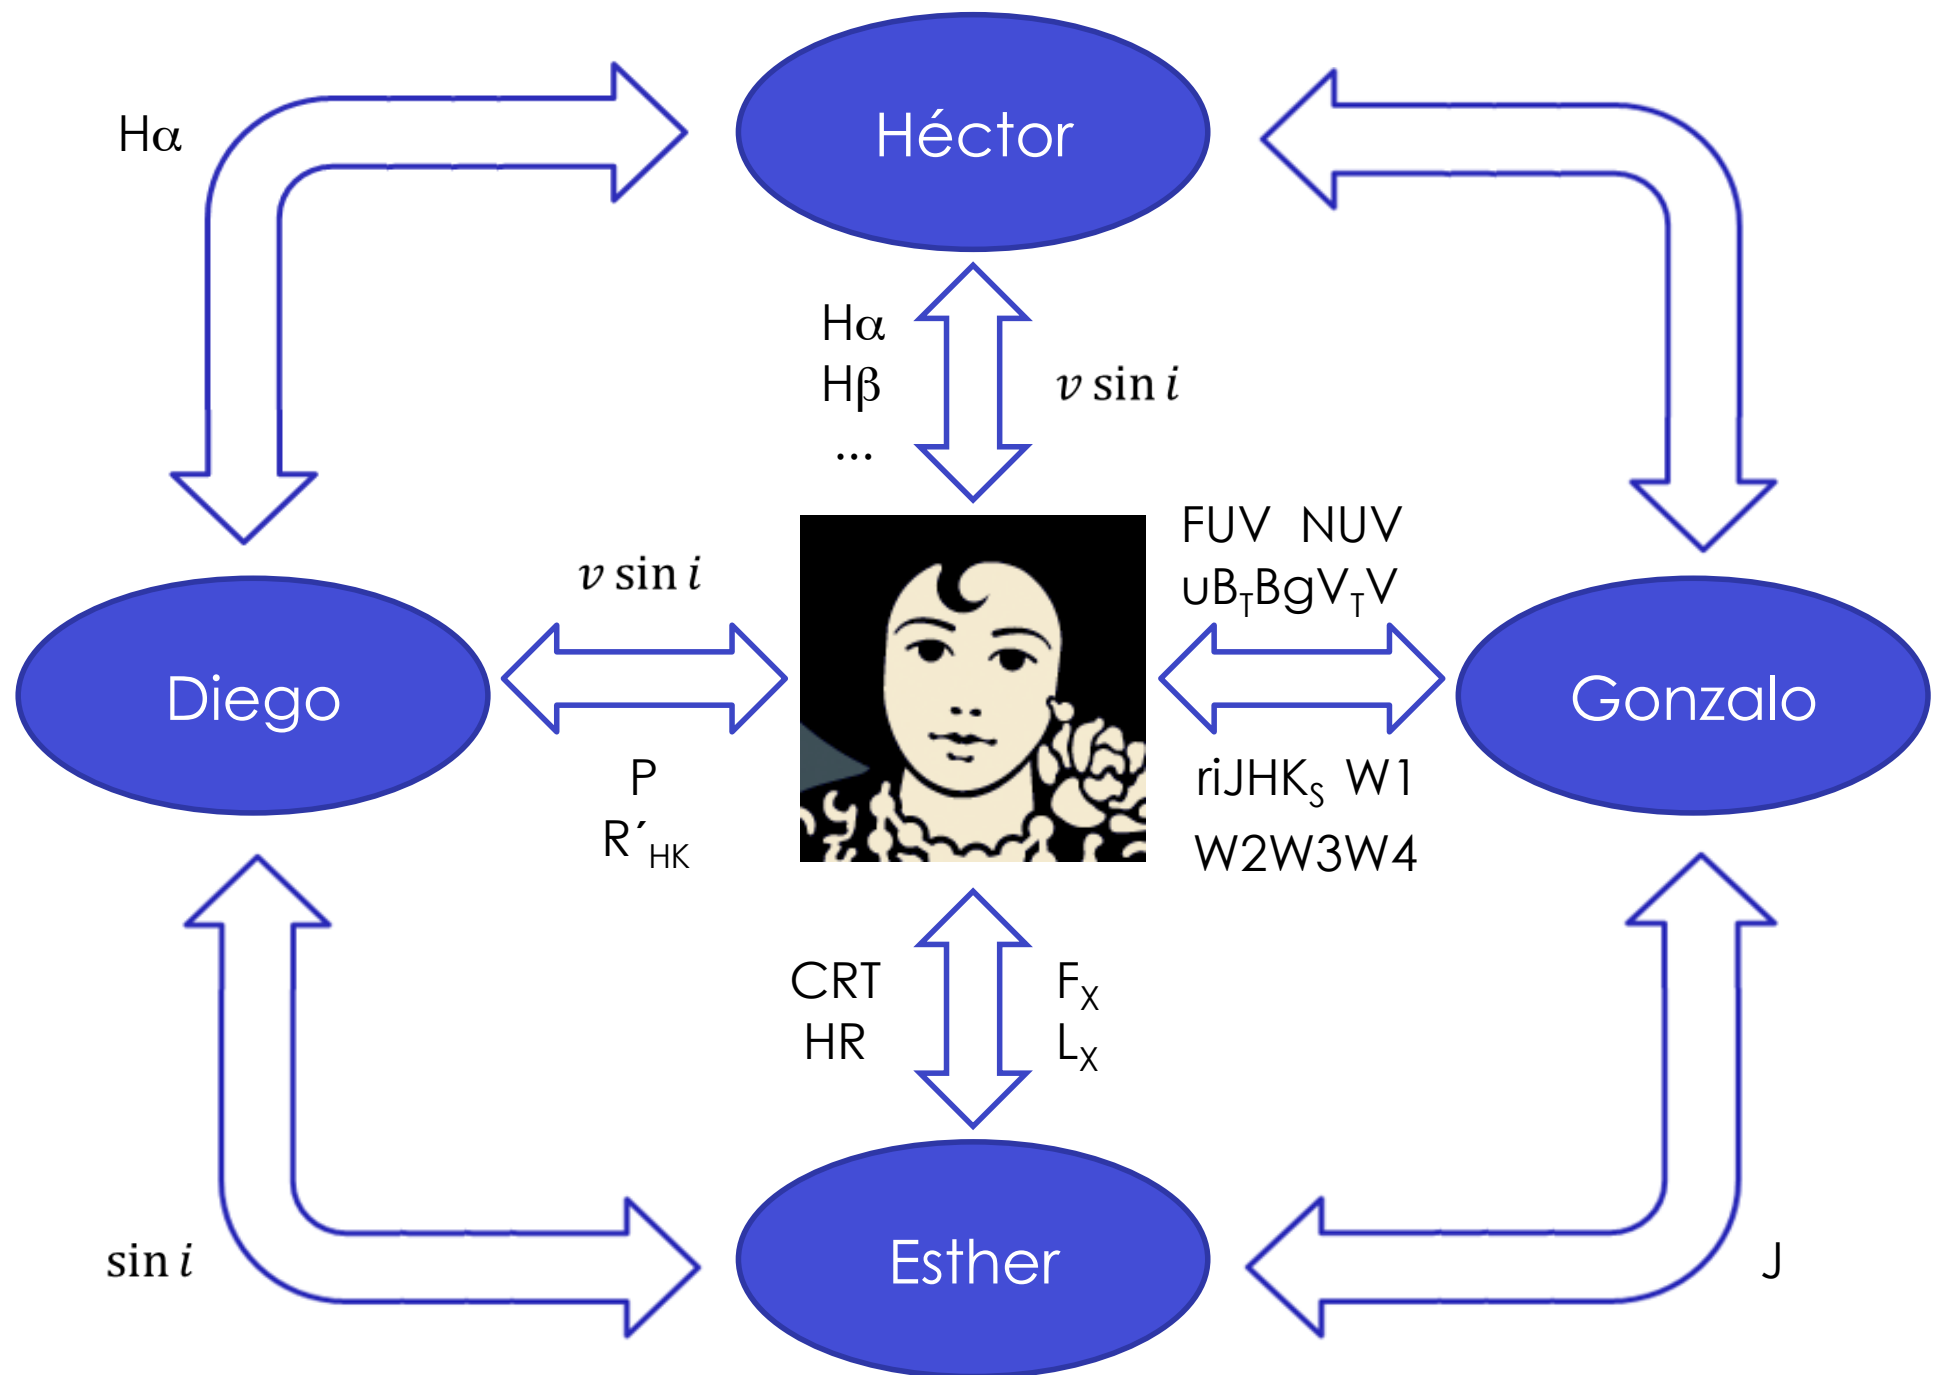

▲ Photometry. Holgado compiled photometric data from GALEX, SDSS, Tycho-2, UCAC4, CMC14, 2MASS and WISE archives for constructing cleansed spectral energy distributions of 158 CARMENCITA stars (*left panel*: SED of FF And) and studying colour-colour relations of 361 bright, late-type, single M dwarfs that surpasses previous works. He also quantified the ultraviolet-excess emission and identified active early M dwarfs (*right panel*: NUV-FUV vs. spectral type).

▲ High-resolution spectroscopy. Martínez-Rodríguez downloaded 128 UVES spectra of 61 CARMENCITA stars in eight channels (*left panel*: BLU437) and measured pseudo-equivalent widths of H α - η , Ca II H&K, Na I D1&2 and He I D3. He measured $pEW(H\alpha)$ of 27 M dwarfs for the first time and studied its relation to other lines in emission (*right panel*: $pEW(H\beta)$ vs. $pEW(H\alpha)$). He also measured $v \sin i$ of 24 stars (7 new) and identified wrong values published in the literature.

▲ X-ray emission. González-Álvarez added new X-ray count-rate and hardness-ratio data of 188 M dwarfs to CARMENCITA. She calculated X-ray fluxes and luminosity ratios L_x/L_j for 770 stars in total and investigated its variation with spectral type (*left panel*) and rotational velocity (*right panel*). She corroborated with a large sample that close binaries (red dots) are more active than single stars and that X-ray saturation starts at $v \sin i \approx 5$ km/s.

▲ Rotation and activity. Hidalgo ransacked dozens of publications and compiled photometric periods for 217 CARMENCITA stars, rotational velocities for 420, $pEW(H\alpha)$ s for 1766, and membership in young moving groups for 44. He studied the relation between spectral type, H α activity (*left panel*), close multiplicity, periods (*right panel*) and $v \sin i$, from where he identified three stars with inclination angles $i = 79.3$ to 81.6 deg: DT Vir AB, BD-21 1074 A and FF And.
